

Psychological Statistics

Measures of Variability

What We Will Cover in This Section

- What variability is.
- Range.
- Interquartile range.
- Variance and Standard deviation.

P325 Variability

2

Two Normal Distributions with the Same Mean

© 2010 2003

P325 Variability

3

Overview

The Mean describes the 'typical' score; measures of variability show how much the rest of the scores in the distribution are spread out around the mean.

© 2003

P325 Variability

4

Range

- The distance between the lowest and highest score.
- Formula
 $\text{Range} = \text{Highest Score} - \text{Lowest Score}$
- Example

1 3 4 6 8 12 15 16 18 19

1 3 4 6 8 12 15 16 18 79

P325 Variability

5

Properties of the Range

1. Gross descriptive statistic.
2. Highly sensitive to extreme scores.
3. Relatively unstable.
4. Insensitive to the shape of the distribution between the two scores.

© 2003

P325 Variability

6

Range Assumptions

1. Scores represent interval or ratio scales.

8/30/2003

P325 Variability

7

Semi-Interquartile Range

- Computation

$$\text{Interquartile Range (IQ)} = P_{75} - P_{25}$$

$$\text{Semi-Interquartile Range (SIQ)} = \frac{P_{75} - P_{25}}{2}$$

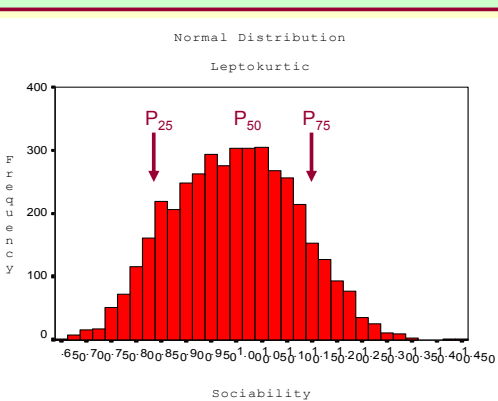

- Interpretation

The distance between the middle 50% of the scores.

8/30/2003

P325 Variability

8

Interquartile Range: Properties

1. Not sensitive to extreme scores.
2. Relatively stable.
3. Does not consider the shape of the distribution.
4. Ignores all but two of the scores.

6/30/2003

P325 Variability

10

Interquartile Range Assumptions

1. Scores represent interval or ratio scales.

6/30/2003

P325 Variability

11

Deviation Score

Score	$X - \bar{X}$	$(X - \bar{X})^2$
5	-2.5	6.25
6	-1.5	2.25
7	-.5	.25
8	.5	.25
9	1.5	2.25
10	2.5	6.25

Sum of Squares

Sum
Mean

45	0	17.50
7.5		2.92

6/30/2003

P325 Variability

12

Sum of Squares

Sum of the squared deviation scores around the mean.

$$SS = \sum (X - \bar{X})^2$$

Variance

Mean squared deviation score

Sample Formula

$$S_x^2 = \frac{\sum (X - \bar{X})^2}{N}$$

Population Formula

$$s_x^2 = \frac{\sum (X - \bar{X})^2}{N-1}$$

Degrees of freedom (df)

Standard Deviation

Square root of the variance.

Sample Formula

$$S_x = \sqrt{\frac{\sum (X - \bar{X})^2}{N}}$$

$$S_x = \sqrt{S_x^2}$$

Population Formula

$$s_x = \sqrt{\frac{\sum (X - \bar{X})^2}{N-1}}$$

$$s_x = \sqrt{s_x^2}$$

Population Parameters

Statistic	Sample	Sample (used to estimate the population)	Population symbol
Variance	S^2	s^2	σ^2
Standard Deviation	S	s	σ

© 2003

P325 Variability

16

Properties of the Standard Deviation

1. Sensitive to the location of each score in the distribution.
2. Sensitive to extreme scores.
3. Resistant to sampling fluctuation.
4. Is used in most higher order statistical computations.

© 2003

P325 Variability

17

Assumptions

1. The variables are measured on an interval or ratio scale.
2. There are no outliers in the distribution.

© 2003

P325 Variability

18

Interpretation and Use

- How much difference is there in a set of scores.
 - Are the scores similar?
- Provides input to other statistical procedures.

6/30/2003

P325 Variability

19

Key Learning Points, Part 1

1. The *Range* is a rough estimate of variability.
2. The *Variance* represents the mean squared deviation score.
3. The *Standard Deviation* is the square root of the variance.
4. The higher the standard deviation the more spread out the scores will be.

6/30/2003

P325 Variability

20

Key Learning Points, Part 2

5. S is the symbol used to represent the sample standard deviation.
6. s^2 is the unbiased estimate of the population variance σ^2 .
7. s is the unbiased estimate of the population standard deviation σ .
