---

---

---

---

---

## Research Problem

A group of students conducted a validation study of the Activity Vector Analysis (AVA). The traditional interpretation of this assessment tool was that people scoring higher on the Sociability scale would be more optimistic than those scoring lower on the scale.

The AVA measures five scales Aggression (V-1), Sociability (V-2), Calmness (V-3), Conformity (V-4), and Conscious Restraint (V-5). One of the criterion measures was the AASQ, a standardized measure of Optimism.

---

---

---

---

---

---

---

---

Linear Equations: Least Squares Criterion

$Y = bX + a$

11/12/2002 P366 Multivariate Correlational Analysis 7

---

---

---

---

---

---

---

---

Terminology: Regression Coefficient (B)

*This is the weight given to each predictor in the regression equation when using raw scores.*

11/12/2002 P366 Multivariate Correlational Analysis 8

---

---

---

---

---

---

---

---

Terminology: Beta Weight ( $\beta$ )

*This is the weight given to each predictor in the regression equation when using z-scores (standard scores).*

11/12/2002 P366 Multivariate Correlational Analysis 9

---

---

---

---

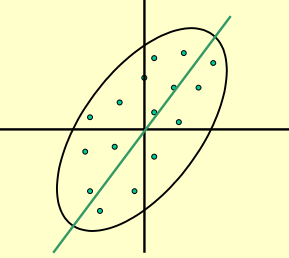

---

---

---

---

### Linear Equations: Z-scores

$$\hat{Z}_Y = r \times Z_X$$

$$\hat{Z}_Y = \beta \times Z_X$$

---

---

---

---

---

---

---

---

### Multiple Correlation Coefficient

- Indicated by R.
- R<sup>2</sup> is equivalent to the *Coefficient of Determination*.
- 1 - R<sup>2</sup> is equivalent to the *Coefficient of Alienation*.

P366 Multivariate Correlational Analysis

13

---

---

---

---

---

---

---

---

Significance Test

- Use *F-test* to assess statistical significance.

$$F = \frac{\text{Mean Treatment Variability}}{\text{Mean Error Variability}}$$

$$F_{(k),(N-k-1)} = \frac{R^2 / k}{(1 - R^2) / (N - k - 1)}$$

14

---

---

---

---

---

---

---

---

Issue #1, Multicollinearity

- A problem that arises when two or more of the predictors are highly correlated.
  - Severely limits the size of R.
  - Individual effects are confounded because of overlapping information.
  - Causes unstable regression coefficients.

11/12/2002

P366 Multivariate Correlational Analysis

15

---

---

---

---

---

---

---

---

**Finding Multicollinearity**

1. Examine the correlation matrix and identify highly correlated variables ( $r > .80$ )
2. Compute **TOLERANCE**.
  - A statistic that indicates multicollinearity among the variables.
  - Ranges from 0 to 1 with higher indicating lower intercorrelations.

11/12/2002 P366 Multivariate Correlational Analysis 16

---

---

---

---

---

---

---

---

**Dealing With Multicollinearity**

- Delete one of the variables.
- Combine the variables.

11/12/2002 P366 Multivariate Correlational Analysis 17

---

---

---

---

---

---

---

---

**Issue #2, Selecting Variables**

- Avoid Sweeney Stew Empiricism.
- Be parsimonious in selecting variables for inclusion in the analysis.

11/12/2002 P366 Multivariate Correlational Analysis 18

---

---

---

---

---

---

---

---

## Multiple Regression Example

A group of students conducted a validation study of the Activity Vector Analysis (AVA). The traditional interpretation of this assessment tool was that people scoring higher on the Sociability scale would be more optimistic than those scoring lower on the scale.

The AVA measures five scales Aggression (V-1), Sociability (V-2), Calmness (V-3), Conformity (V-4), and Conscious Restraint (V-5). One of the criterion measures was the AASQ, a standardized measure of Optimism.

## Multiple Regression Techniques

11/12/2002

P366 Multivariate Correlational Analysis

21

---

---

---

---

---

---

---

---

## Standard Multiple Regression

- All of the variables are entered at once.
- Provides an indication of the amount of variability that each variable contributes to the criterion variable.
- Problem.
  - It capitalizes on chance relationships.

P366 Multivariate Correlational Analysis

22

## Simultaneous Regression

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.468 <sup>a</sup>	.219	.180	5.7323	.219	5.512	5	98	.000

<sup>a</sup>. Predictors: (Constant), Conscious Restraint, C score, Conformity, C score, Calmness, C score, Sociability, C score, Assertiveness, C score

Coefficients<sup>a</sup>

Model		Unstandardized Coefficients		Standardized Coefficients		Collinearity Statistics		
		B	Std. Error	Beta	t	Sig.	Tolerance	VIF
1	(Constant)	48.918	4.892		10.427	.000		
	Assertiveness, C score	8.851E-02	.108	.11	.817	.416	.402	2.485
	Sociability, C score	1.094E-02	.071	.02	.155	.877	.740	1.351
	Calmness, C score	5.567E-02	.068	.064	.813	.418	.746	1.341
	Conformity, C score	-.283	.062	-.475	-4.572	.000	.739	1.354
	Conscious Restraint, C score	.153	.097	.211	1.572	.119	.442	2.263

<sup>a</sup>. Dependent Variable: AASQ Total

11/12/2002

P366 Multivariate Correlational Analysis

23

## Stepwise Multiple Regression

- **Forward and Stepwise.**
  - Predictors are entered one at a time starting with the variable that has the highest correlation with the criterion variable.
  - After each predictor is entered statistical tests are conducted to determine if the the next variable will significantly enhance R or R<sup>2</sup>.
- **Backward**
  - All predictors are entered.
  - Significance tests are conducted for each variable as if it were the last one entered.
  - If the variable does not contribute a significant amount to R it is dropped.

11/12/2002

P366 Multivariate Correlational Analysis

24

## Stepwise Regression

**Model Summary**

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.344 <sup>a</sup>	.118	.110	5.9714	.118	13.707	1	102	.000
2	.458 <sup>b</sup>	.209	.194	5.6829	.091	11.618	1	101	.001

a. Predictors: (Constant), Conformity, C score  
b. Predictors: (Constant), Conformity, C score, Conscious Restraint, C score

**Coefficients<sup>a</sup>**

Model		Unstandardized Coefficients		Standardized Coefficients		Collinearity Statistics		
		B	Std. Error	Beta	t	Sig.	Tolerance	VIF
1	(Constant)	58.638	3.169		18.501	.000		
	Conformity, C score	-.236	.056	-.344	-3.702	.000	1.000	1.000
2	(Constant)	51.869	3.611		14.363	.000		
	Conformity, C score	-.262	.055	-.439	-4.732	.000	.911	1.098
	Conscious Restraint, C score	.229	.067	.316	3.409	.001	.911	1.098

a. Dependent Variable: AASQ Total

---

---

---

---

---

---

---

---

---

---

---

---

## Cross-validation

- **FACT.** Multiple regression maximizes the least squares criterion for the sample on which the analysis is being performed.
- **SHRINKAGE.** The reduction in R when an equation developed in one sample is used in another sample.
- **WHY?** Different samples will yield different results because of sampling error.

11/12/2002 P366 Multivariate Correlational Analysis 26

---

---

---

---

---

---

---

---

---

---

---

---

## How to Cross-validate

- Replicate the study with another random sample from the same population.
- Split the original sample into two sub-samples and develop an equation for each sub-sample.

11/12/2002 P366 Multivariate Correlational Analysis 27

---

---

---

---

---

---

---

---

---

---

---

---

## Canonical Correlation

11/12/2002 P366 Multivariate Correlational Analysis 28

---

---

---

---

---

---

---

---

## Research Problem

- **Predictors.**
  - Seat location.
  - Grade point average.
  - Commuter status.
  - Working hours.
  - Verbal skills.
  - Quantitative skills.
- **Criterion.**
  - Class grade.
  - Partying.
  - Class participation.
  - Extracurricular activities.
  - Class attendance.

11/12/2002 P366 Multivariate Correlational Analysis 29

---

---

---

---

---

---

---

---

## Variables, Variates, and Variate Pairs

**Variate 1**

GPA+Verbal+Quantitative ↔ Grade + Attendance

---

**Variate 2**

Commuter Status+ Working hours ↔ Attendance + Extracurricular

11/12/2002 P366 Multivariate Correlational Analysis 30

---

---

---

---

---

---

---

---

## What You Learn

1. What are the variates?
2. How many variate pairs are there?
3. How to interpret the variates?
4. What is the correlation between the variate pairs?
5. Are the canonical variate scores interpretable?

11/12/2002

P766 Multivariate Correlational Analysis

31

---

---

---

---

---

---

---

---

## Issues

1. Number of cases required.
2. Assumption of normality.
3. Missing data.
4. Absence of outliers.
5. Absence of multicollinearity.
